

# ABSTRACT

When a communication device sends an image pickup instruction signal to an image pickup device by remote control, positional information obtained by the communication device is also sent. Upon reception of the image pickup instruction signal, the image pickup device performs image pickup. When storing a taken image, the positional information received is stored in the header of the image. Moreover, when searching an image stored in the image pickup device from the communication device, the image pickup device informs the communication device of search conditions (time information, positional information, and keyword) added to the image and positional information attribute (GPS information, base station ID, and character data). The communication device performs search by using the search condition and the positional information attribute informed by the image pickup device.
